

Transcript & Workflow Quality Challenge

Overview

You will be given:

1. A raw ASR transcript (contains errors)
2. A "processed" transcript from an AI system
3. A JSON metadata file (speaker labels, timestamps)
4. A simple workflow scenario (job → transcription → review → completion)

Task 1 — Identify Issues

Review the transcript and metadata.

List at least 10 issues, including:

- transcription errors
- formatting problems
- speaker attribution issues
- timestamp inconsistencies

For each issue:

- describe the problem
- explain why it matters

Task 2 — Test Case Design

Create at least 8 test cases that would catch these issues.

Each test case should include:

- description
- input
- expected output
- failure condition

Task 3 — API Testing Plan

You are given a hypothetical API:

POST /transcripts/process
GET /transcripts/:id

Describe:

- how you would test these endpoints
- edge cases to consider
- validation rules

Task 4 — Workflow Testing

Given a workflow:

NEW → ASSIGNED → TRANSCRIBED → REVIEWED →

COMPLETED Design tests for:

- valid transitions
- invalid transitions
- edge cases (e.g. reassignment, skipped steps)

Task 5 — Automation Approach

Describe how you would automate testing for this system.

Include:

tools you would use
example test structure (pseudo-code acceptable)
how you would integrate into CI/CD

Bonus (Optional)

Propose a scoring system (0–100) for transcript quality
Suggest how to detect issues programmatically (rules or heuristics)

Deliverables

Markdown or PDF document
Optional: GitHub repo with example scripts

Evaluation Criteria

Analytical Ability

Identifies meaningful issues
Understands real-world implications

Test Design

Quality and completeness of test cases
Coverage of edge cases

Technical Thinking

Automation strategy
API testing understanding

Clarity

Structured, well-explained answers

What We're Looking For

Attention to detail
Structured thinking
Ability to test complex systems (not just UI flows)
